Developed by the American company Autodesk, Autodesk AutoCAD is a commercial CAD and drafting software application.

Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. Developed and marketed by Autodesk, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. AutoCAD can be used in two primary ways: as a drafting and design application, and as a spreadsheet. Withdrawing a 2D or 3D view of a drawing or document allows a user to start a new drawing or design, or begin a new spreadsheet. Withdrawing can also be used to clone an object from another drawing or drawing element. AutoCAD is comprised of numerous drawing

components, such as objects, blocks, styles, grips, dimensions, and references. Unlike most CAD applications, which let the user draw the individual components directly on the screen, AutoCAD has a more realistic, user-friendly approach that has helped to make it a widely used CAD application. If a user wants to draw a simple circle on a piece of paper, AutoCAD would allow the user to do so, then add the line to the drawing canvas. AutoCAD is a 2D CAD application, which means that the user must always have a reference plane to work from. Users can, however, use the command Line command to place a dimension, which allows them to determine the exact location of the object's edge, no matter which reference plane they are working from. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal.

The fossil remains found in the cave include horses, giraffes and mastodons. Cueva del Combón is the first collection of fossils of horses found in Argentina. History In 1892, a local named Jorge Lopes found the fossilized remains of a horse, which he called "Cabeza del Pacheco". The remains were sent to the Museo de Ciencias Naturales of the University of Buenos Aires, and were studied by paleontologists Jose María Heredia and Félix Huber. They were later sent to a museum in Munich, where they remained until 1935, when they were repatriated to Argentina. On this occasion, the fossils were again studied by Heredia and Huber. In 1937, the fossils were taken to the Museo Paleontológico de La Plata, where they remained until 1955, when they were returned to the Museo de Ciencias Naturales de La Plata. In 1985, the remains were again sent to the Museo Paleontológico de La Plata, where they remain.
