The Avoid Internet Disconnection utility is an Internet connection monitoring utility that lets you protect your connection from being disconnected when there is no activity for a specified time period. It is designed to be run without any input from you, but if you would like to help in testing, you can use it to log your connection's history. Many businesses and individuals use the Avoid Internet Disconnection utility to let their network connections stay connected. The Avoid Internet Disconnection utility keeps your connection alive even if you have no activity for a specified time period. If your connection is idle for a period of time, it will be dropped. The utility is easy to use, and there is no need for you to configure any settings to keep your connection alive. With the Avoid Internet Disconnection utility you can: Monitor and log your connection history Turn your connection active or inactive, depending on the duration of inactivity Define an interval (from 4 minutes to 1 hour) after which your connection will be turned off Define the type of detection technique: detect whether a port is idle for a specified time period, based on the amount of time since the last time the port has been active detect whether a port is idle based on the elapsed time since the last time the port has been active Define the length of time after which your connection will be disconnected (by a specific time period) Define how to deal with timeout errors (by clicking on the "Ignore Timeout Error" button) Output history information on a per-connection basis, and on a log file basis

Warning: This utility is not intended to replace or be used in place of the usual way of monitoring your connection and keeping it connected; in most cases, when a connection is idle for a period of time, it is best to disable your network connection. When this utility is used, if your connection is idle for a specified time, it will be turned off. When this utility is used, if your connection is idle for a specified time, it will be

MAKE YOUR ISP DISCONNECTS YOUR CONNECTION AFTER YOU SIGN OFF, STOP THE PC, UNPLUG THE MODEM, OR CLOSE THE NATIVE BROWSER. QUICKLY ON/OFF WITH PRESSES OF BUTTONS. ISP CAN CONTINUE TO MONITOR YOUR INTERNET USE WITHOUT SHORTENING THE CONNECTION TO YOUR COMPUTER IF YOU CLICKED ON A LINK. WHILE THE DISCONNECTION ISN'T LIVE, ITS RECORDED DURING THE NEXT 4 MINUTES. CONVERTING THE DISCONNECTION TO A CONTINUATION, IF YOU CLICK ON A LINK AND YOUR ACCOUNT DOESN'T GET LOGGED OUT. Your Internet Connections become inactive after you sign off. After this, if your Internet Connections are not disconnected within 4

minutes, your Internet connection remains active. You can check the number of minutes left by clicking on the Internet Connections icon and selecting "View > Disconnect Time". You can then connect back to the internet. Connections become inactive after the 4 minutes. After the 4 minutes, your connection becomes inactive. Internet will continue to function normally, but the Internet connections will not be available until you reconnect. In other words, the connection will become available again. You will receive a popup every 10 seconds asking you to reconnect your computer. If you don't reconnect, you will receive a popup every 5 minutes. I use the hotkey or button combination: Ctrl-Alt-Del, Alt-F4 or Shift-Right Arrow on PC keyboard. How to set up Auto Reconnect: 1. You need to set Internet connections to always on. 1. To change the settings of your connection. Choose the arrow-down menu button on the top right corner of the Internet Connections area and select the "Set Connections Settings..." option. 2. Click the radio button beside the words "Always On" to make the connection always on. 1. Select the settings of the connections that you want to have always on and uncheck the "Always On" option. 2. Click "OK". 3. This will start a process. When it is completed you will see "Connections changed successfully" message. You can check the status of the connection. If you are using any VPN you should exit it first before restarting the PC. If you are working on other computer (like laptop or smartpone) 77a5ca646e

- The program will always active - As you start your PC, you have to click "Run" on the program to start the stop/kill the programs - The stop/kill the programs stops the idle connect - If you close your computer it will go to the main menu on the website and you click "Stop" to start the stop/kill the programs and reconnect to your internet service provider Settings Automatic and/or Manual Internet Connection will start without any password internet connection. Do not remove this program, it works perfectly! Manual or Automatic connection, what's the difference? - Automatic internet connection works perfect because it has been programmed for you to use the internet with no password. - Manual internet connection, you can use internet with any password. - Manual internet connection works perfectly because it has been programmed for you to use the internet with any password. The Wizard will help you to connect to the internet. The Wizard is divided into 3 parts: Setup, Connection and Connection Maintenance. Features of the Wizard - Wizard will let you to get connected to internet with or without an ID (username) and password. - Wizard is easy to use and easy to understand. - Wizard allows you to change the name and location of your computer. - Wizard allows you to check your current settings. - Wizard helps you to set-up, change or reset your network settings, such as your computer name, location and passwords. Wi-Fi Network is connection wireless to the internet, this connection is highly used for sharing internet using wireless devices such as portable laptops, phone, etc. The Wi-Fi Network uses the wireless (802.11) communication standards to exchange data with other devices. Wi-Fi is also known as Wireless Local Area Network (WLAN), where it is used to connect devices using radio signals. WiFi is an alternative to the traditional wired LAN technology. In addition to the commonly available 802.11b/g standards, a number of newer, more efficient wireless standards are being implemented or are being developed to extend the range of wireless connections. For example, 802.11n is a specification that builds on the existing 802.11b/g standards to provide wireless connections to devices at much higher speeds. 802.11h allows a Wi-Fi enabled device to use three antennas to transmit data. 802.11n devices will use the same antennas as 802.11b/g devices, and will not increase the maximum distance

Internet Disconnection is an application which will notify you when someone is accessing your computer. The idea is to avoid internet disconnection during long sessions. The program will automatically reboot your computer every 4 minutes in order to send one of the pre-defined signals to your ISP. There are several types of signals: - 1: Restart your computer so you will not lose internet connection - 2: Move your modem to sleep mode - 3: Move your modem to power saving mode - 4: Close the "User Login" window (you must close all your applications before you turn off your computer) - 5: Click on a message box to see if someone

is accessing your computer - 6: Click on a button to send a message or "Disable" your signal

About this creation About the Author Thomas Blanckenstein Contact me on tom dotblanckensteinen@gmail.com Description: The application sends various signals to your Internet Service Provider. The idea is to avoid internet disconnection during long sessions. The program will automatically reboot your computer every 4 minutes in order to send one of the pre-defined signals to your ISP.
