We reviewed published studies to determine whether pretest probability estimates could be derived from host and demographic variables to predict the probability of acquiring the acquired immune deficiency syndrome (AIDS). Although the available literature was limited, our findings suggest that a pretest probability estimate derived from host and demographic variables might be useful in predicting the risk of acquiring AIDS, especially in communities at high risk for AIDS. To this end, an estimate of pretest probability could be used as a tool in counseling and risk-reduction strategies for both populations at high risk and populations at low risk.
