This beginner's guide will teach you the basics of Photoshop and how to get started as a photographer, graphic artist, or multimedia designer. A Quick Primer on Photoshop Layers Photoshop is very similar to other image editors. Often referred to as "pixel snippers," graphic artists use layers to manipulate individual pixels and photographs as though they were a giant 3-D puzzle. The basic way you manipulate an image is to cut (or crop) out a specific area, remove part of the background, or replace another image in that area. These operations are known as using Photoshop's Layers. A layer is a box that sits on top of other boxes. It has certain properties for lighting, transparency, and color. You can create one by clicking on "New" in the tool bar. Layers also have commands you can use to move, resize, and delete them. Layers are normally organized into groups known as "Channels." You can move, edit, and rotate groups, and group layers can be turned into symbols, masks, or patterns, depending on the type of editing you want to do. You can load a group of layers into Photoshop in a specific channel such as Darken or Dodge by using the groups channel box or selecting them in the main window before going to the Layers panel. You can also create a new layer that you can name, and make adjustments to it. Layers may be placed into one of six color channels: Black, White, Cyan, Magenta, Yellow, or Red. You'll use the Blue and Green channels as the default, and these will be included with the basic Create a New Layer feature. You can choose different channels using the channel box. Channels also have the ability to be either muted or turned on, depending on whether you want to keep the color information or suppress it. If you mute the channel, you'll be eliminating all changes on that layer. Mute a channel by selecting the channel, clicking on the little circle to the right of the word Muted in the channel name, and then clicking OK in the dialog that appears. By default channels are muted. Channels may be used to create transparency or have patterns added to them. You can see both types of functionality on an individual layer with a channel as well. You can add transparency by selecting any of the channels and clicking the checkbox to the right of "Mask." You can add

In general, the present invention relates to an image pickup device. More particularly, the invention relates to an image pickup device which, when used to pick up images of an object and the like, is provided with an arrangement that eliminates an image of a camera user, for example, from an object to be picked up. This kind of image pickup device may be used in, for example, a video camera for monitoring an individual's activities and health and video camera for monitoring a construction site. Further, it may be used in various other applications. In general, the term "image pickup device" used herein includes a CCD, a CMOS image sensor or the like. In the past, image pickup devices have, from the viewpoint of portability, typically been carried on a person's body or supported in hand. However, the video camera or the like tends to be expensive and the image pickup device is not always conveniently carried on a person's body. Therefore, a video camera for monitoring and the like has been proposed that has an image pickup device arranged in the wrist of a user and which picks up an image of an object from the wrist and displays a video image of the object on a display (for example, refer to Japanese Unexamined Patent Application Publication No. 2002-324769). However, if an image of a person's hand, which is an object to be picked up, is displayed on the image pickup device, it is difficult to easily recognize the background. In particular, if the user of the video camera is performing an exercise, it is even more difficult to easily recognize the background. An object of the present invention is to provide an image pickup device, which has an arrangement that eliminates an image of a camera user from an object to be picked up and is therefore capable of picking up an image of a desired object without being affected by the camera user's movements. Isolation, identification and characterization of microparticles from porcine macrophages after electroporation. Macrophages are important for innate immunity against foreign pathogens and as a potential source of cytokines for cancer therapy. Electroporation is a non-thermal method for enhancing the transfection efficiency of macrophages. In the present study, we report isolation, identification and characterization of microparticles secreted by macrophages after electroporation. Microparticles from macrophages after electroporation treatment were detected by western blotting with the endoplasm
