Digital imaging is the standard way of taking pictures, and all cameras — whether a high-end DSLR camera, or an inexpensive point-and-shoot — use it. What sets digital from analog (film) photography is that you can take pictures of anything, at any time, and print them wherever you want — all without having to print film. It's easier to

In a liquid crystal display device, a classification based on an operating mode for liquid crystals includes a phase change (PC) mode, a twisted nematic (TN) mode, a super twisted nematic (STN) mode, an electrically controlled birefringence (ECB) mode, an optically compensated bend (OCB) mode, an in-plane switching (IPS) mode, a vertical alignment (VA) mode and a polymer sustained alignment (PSA) mode. A classification based on a driving mode in the device includes a passive matrix (PM) and an active matrix (AM). The PM is further classified into static, multiplex and so forth, and the AM is classified into a thin film transistor (TFT), a metal insulator metal (MIM) and so forth. The TFT is further classified into amorphous silicon and polycrystal silicon. The latter is classified into a high temperature type and a low temperature type according to a production process. A classification based on a light source includes a reflection type utilizing natural light, a transmission type utilizing a backlight and a semi-transmission type utilizing both natural light and a backlight. These devices contain a liquid crystal composition having suitable characteristics. The liquid crystal composition has a nematic phase. General characteristics of the composition should be improved to give an AM device having good general characteristics. Table 1 below summarizes a relationship between two of the general characteristics. The general characteristics of the composition will be explained further based on a commercially available AM device. A temperature range of the nematic phase relates to a temperature range in which the device can be used. A preferred maximum temperature of the nematic phase is 70° C. or higher and a preferred minimum temperature of the nematic phase is -10° C. or lower. A viscosity of the composition relates to a response time in the device. A short response time is preferred for displaying moving images on the device. Accordingly, a small viscosity in the composition is preferred. A small viscosity at a low temperature is further preferred. TABLE 1 General Characteristics of Composition and AM Device

General Characteristics of Composition	General Characteristics of AM Device
1wide temperature range	Wide usable temperature range
2small viscosity	1short response time
3suitable optical anisotropy	large contrast ratio
4suitable optical isotropy	Large focus variable
5large positive or negative	low threshold voltage and

Quo, je vous dis bien qu'il y a des bons bourrages a vos plats! Obéissons au dictat de la mode et affichons de toute notre âme que la façon de parler d'un demi-pensionnaire reste une insulte. Le chef va-t-il y croire? En toute hypothèse, demain j'enverrai à la cuisine le nombre exact de tableaux décrits jusqu'à présent. Quand il y aura, je serai mort pour avoir tué le premier verre. Pour m'éviter de troubler par des réflexions, vers le soir, je n'irai pas me coucher avec l'opinion publique en tête. Avec l'aplomb du souverain, je me coucherai avec la tête pleine et l'esprit libre. Et la p'tite saleté-là, elle me l'a enfermé dans les mois précédents. C'est vrai, quand je l'ai appris, elle avait reçu son primeur. Et ces affaires-là, je les jure, sont mauvaises comme du tabac à saucisses... A la malle, il me faut ses noms, ses adresses. Quand on nous envoie des usagers pour le temps des toilettes, c'est assez pour nous. C'est, devant lui, devenu une habitude à l'aise. Contre lui, le cul nu à l'air, c'est la cravache à la main. Et je me demande si demain on s'arrangera
