Tip: You may get more help from Photoshop teaching articles on the web than from this book. Try `www.dummies.com/go/photoshoptips` for more tips and tricks for Photoshop. Like the other Adobe application programs, Photoshop has a separate layer-based image editing system, as seen in Figure 5-2. Unlike the other Photoshop application programs, however, it also has many tools for raster (bitmap) editing, like the brush, paint bucket, eraser, and path tools. Photoshop has a drawing tool, the pen or vector tool, that enables you to draw a vector path within an image. You can then move around the path and scale the path to change the final size and shape of the image. Photoshop has a host of special features: including retouching tools for removing blemishes, adding highlights and shadows, and fixing problems with color, exposure, and other image issues. These special features make Photoshop unique. They also make Photoshop more intimidating to use for beginners. **Figure 5-2:** The layer-based image editing system in Photoshop is similar to layers in Microsoft PowerPoint. Surprisingly, Photoshop includes many tools for manipulating the pixels of a raster image. These tools are located within the Tools⇒Edit⇒Image menu and include tools to modify individual color channels (such as red, green, and blue) or selected colors or to create a grayscale image. Image Adjustments: Making Colors Pop Unlike the other Adobe application programs, Photoshop doesn't have a ton of options for exposure, contrast, and sharpening. However, you can get some really great results by just using the basic tools. In this section, we introduce you to the basic features of the tools in Photoshop. We offer some strategies for getting the best results from Photoshop's adjustment tools, including lightening, darkening, and adding color. Tone One of the easiest ways to add color to a photo is to adjust the tone (that is, color) of the photo. You can tone a photo to brighten or darken it. By adjusting the tone, you can give a photo a pop of color without adjusting the actual colors of the photo. You can adjust the tone by simply clicking on one of the existing colors in the image to make that color appear brighter or darker. You can also add a dark or light color to the existing colors.

Key Takeaways Job retention is defined as the action of keeping a job. Job retention is the retention of jobs in the manufacturing and service sectors in particular. Factors that contribute to job retention are a decrease in unemployment or an increase in job creation, the ability to sell jobs, the ability to buy low-cost labor and other costs, the state of the local and national economy, and the distribution of jobs. Job retention typically describes work that is not economically or socially beneficial. Job retention is the concept that companies need to pay higher salaries for jobs that lower salaries, like outsourcing. Job retention deals with the ideas of what jobs businesses have to offer and how to attract candidates, including internships, job fairs, open houses, magazine ads, and press releases. We've highlighted some of the top job retention strategies in the manufacturing and service industries to help businesses and associations get the most out of these low-cost ways of keeping jobs. Q: How to generate a.cshtml page from a.cshtml template How do I generate a.cshtml file based on a.cshtml template file? I have a templates folder where all my.cshtml templates are stored, and I have an index.cshtml file which is expected to be generated. The.cshtml templates are not expected to be used just by generating a new cshtml file but also using them in an existing.cshtml page. I have tried to use the following code, but it doesn't work: @functions{ public string GenerateCshtml(TemplateModel template) { //how do I render the template file? StringBuilder output = new StringBuilder(); output.AppendLine(@" Cshtml template "); output.AppendLine(@" "); return output.ToString(); } } @model TemplateModel @{ ViewBag.Title = "Generate cshtml template"; Layout = "~/Views/Shared/_Layout.cshtml"; } Generate cshtml template Input cshtml template: @Html.TextBoxFor(m => m.Name, new { type = "text" }) @{ ViewBag.Title = "Output cshtml template"; Layout = "~/Views/Shared/_Layout.cshtml"; } Output c

Q: How do I script install of a Cabal package on a remote server? I want to automate the installation of some packages on a remote server. The packages are an entire Cabal project. The packages are all for Linux and are listed in the Cabal library at Most of the projects appear to be internally hosted (like the Cabal packages). For those which are hosted externally, the documentation I've seen doesn't make it clear how to install these packages, i.e. I have tried cabal install cabal install cabal install cabal install and I've tried cabal install -v and I've tried to list the packages one-by-one. What's the right way to do this? My goal is to script a Dockerfile. I'll be creating a Docker image for an application I'm developing. I'd like to install packages once and have the application and all its dependencies work properly. A: The way you did it works because Cabal is not installed with cabal install as it is when you install a Cabal package. You can use cabal sandbox init and cabal install, or cabal sandbox init then cabal install --dry-run. The sandbox is a repository of packages that can be accessed by cabal.
