History AutoCAD has evolved through many versions, each aimed at a specific audience and addressing specific needs of the users. From a very simple mechanical drafting program, AutoCAD has grown into a complex computer-aided design (CAD) application that has been used by architects, engineers, graphic designers, CAD operators, and construction companies. AutoCAD has also evolved into an industry standard for computer-aided drafting and design. Early history AutoCAD's original version 2.0, released in 1989, was written by Dan Thornton, a mechanical engineering student at the University of Colorado in Boulder. Based on a commercially licensed version of his own design, it became an overnight success. The software was even included in the Macintosh OS catalog by Steve Jobs. It soon became the most popular and profitable software program ever written by one person. Thornton eventually sold his software company, the AutoCAD Corporation, to Autodesk, which now markets and supports the product.

AutoCAD's genesis: The original AutoCAD drawing of Dan Thornton. Dan invented AutoCAD as an undergraduate student at the University of Colorado. The program was initially developed for use on a microcomputer that had an internal graphics board. Thornton's original version 2.0 CAD program was successful, but it was not widely distributed, was slow and expensive to use, and lacked many of the advanced features that are now considered standard for a CAD program. In 1989, AutoCAD V2.0 was developed by Dan Thornton. The free trial version was launched on January 27, 1989, at an industry trade show. Thornton had designed the software on a hand-written sheet of paper. The software was initially named the "Mark V" after his wife's mark, "Mark V," on the then-new round shape laser printers of the time. The software was named the "Mark V" because Thornton thought the software would be an inexpensive "simple" program. While this is true, it is also true that the "Mark V" program was not simple and never priced to be simple. He worked with a friend on a more advanced plan, but was never able to get to the final product as he was busy with graduation and

other activities. Later, Thornton came across a brochure for the Blackberry, a mobile phone that would be released in 1992. It had an internal graphics board and had to be

the cerebral cortex. T3 dystrophy of the cerebral
cortex is a distinctive clinicopathological entity

affecting infants and children. We investigated 27 cases of this syndrome. Gross abnormalities include a smooth raised cortex and a profound myelin pallor. The microscopic appearance of the white matter is characterised by increased numbers of axons, thickened myelin sheaths and disorganised clusters of oligodendrocytes. The cytoarchitecture of the neocortex is normal. T3 dystrophy is associated with cerebellar hypoplasia in 18 of the cases. The neurological and neurodevelopmental outcome is variable, and even mild cases may develop mental retardation.

. Nevertheless, these aforementioned patents fail to contemplate the construction of a snowboard binding that would not only stabilize the rider's feet during the riding process but would also provide the rider with a platform for riding the snowboard. U.S. Pat. No. 5,152,286 to Blaisdell is directed to a binding in which a knee action is employed to lock the binding to the snowboard. Such bindings would be useful for keeping the snowboard rider from engaging in extreme maneuvers on the board. The Blaisdell binding is, however, a one-time use binding. It would therefore be desirable to have a multiple use binding that would allow the user to disengage his feet from the binding for walking and skiing, and engage the binding upon boarding the snowboard. U.S. Pat. No. 4,638,999 to Gordon is directed to a snowboard binding having a pin that is disposed through a base plate and the rider's boot sole. The base plate is engageable with a toothed cam and the pin with a slot that positions the pin relative to the base plate. The pin and slot arrangement is, however,

purely mechanical in nature and requires close machining tolerances to provide the necessary positional orientation between the pin and base plate. Accordingly, it is an object of the invention to provide a snowboard binding that provides a great amount of traction to the rider's feet. Another object of the invention is to provide a snowboard binding that includes a built-in antifriction device. Still another object of the invention is to provide a snowboard binding that includes a handle that can be used to engage the binding with the snowboard. Yet another object of the invention is to provide a snowboard binding that is easily released from the snowboard for walking and skiing. A further object of the invention is to provide a snowboard binding that maintains its grip on the board throughout various types of snowboarding maneuvers. A further object of the invention is to provide a snowboard binding that can be quickly and easily installed. Another object of the invention is to provide a snowboard binding that provides the rider with an extra hand grip to hold the snowboard. Still another object of the invention is to provide a snowboard binding that is inexpensive to
