Unlike earlier discussions regarding the use of JavaScript or HTML5 APIs, this involves the actual act of manipulation of the image itself. The upcoming upgrade of the platform means its developer tools will perform the task through native APIs to avoid errors due to browser version changes. As a result, an improved Photoshop file format will clearly document each change and clearly describe the effects and possible deviations. This will improve future proofing, and the automated scripting capacity will make it easier for developers to extend the Photoshop numeric capabilities. **Adobe Photoshop** - This new event-driven mode is designed to allow developers to connect modules by making a call or timing a wait. This is in direct contrast to the more straightforward callback model used in extension development. event-driven API modules will utilize an application-driven model, where events are delivered asynchronously and will be delivered only after the module has finished processing. **Adobe Photoshop** -Perspective transform will provide automatic angle correction, perspective distortion and rotation. This scale will both preserve the aspect ratio of both dimensions when they are changed, and preserve the shape of the image. Perspective transform will allows a wider range of angles and scales to be used **Adobe Photoshop** - Crop will use a new kernel, where the algorithm is optimized for performance, and the user when using Crop Tool becomes part of the selection, which makes the process of selection more intuitive.
