Although the process of scanning the computer takes too long than we would expected, V-Buster makes its job well notifying you each time a virus is found. In case your computer is clean, the command-line utility will close without interrupting you from your work. Though, in case a virus is detected and you want to see the test results, you can easily open the report from the main window of the application. It will display the path of the infected file and the name of the encountered virus. All things considered, V-Buster offers a simple software solution for helping you detect the presence of suspicious files in your computer. Since no advanced configurations are required, even less experienced users can master the scanning process with minimum effort. Viruses can easily access your PC without a hitch. Even if your computer is configured for a secure environment, there are various types of software that are designed to steal personal information and spy on your activities. The program will scan all the hard drives and if it detects a virus, it will remove it. In case a virus is detected, the application will warn the user and will allow him to remove the threat without any trouble. The scanner can be launched from the main window of the application or from the command line. To view the complete results, you need to open the program's default folder.
