The name is now “Adobe Elements,” not Photoshop Elements, which has been the name since the program was licensed from The Pixel Factory. The other big change is that Elements now supports 32-bit floating point images -- it’s the default setting in Elements 21. Support for 32-bit floating point images, or floating-point files, is becoming more and more common. We’re already beginning to see Adobe releasing Photoshop and other products in this mode. Elements 21 supports a new “search all elements” function (accessed with the ubiquitous control+f keyboard shortcut). You can search for and find specific images, bits, layers, path elements, actions, smart objects, etc. in an image. You can even customize which types and where your results will be located in the list. The “one action” edits are stronger than ever. Making global changes to an image is a snap with the new “Quick Edit actions” and “autosave action.” You can also save your actions in the program for future use. Elements’ new “web-safe” save option has been greatly enhanced. The web-safe save place is now a file browser with a browser tab for any selected files automatically set to save to that location. Another beta for registered users, but the increased performance over Lightroom 4 is what we’re most excited about. If you’re in the Beta Program when you upgrade from Lightroom 4 or Lightroom 5 beta, you automatically get to participate in this release. It’s a fresh approach to catching up on the latest software news and technology. It’s also one of the most anticipated pieces of software this year, because it is synonymous with the Hollywood elite.
