Apple has announced iMovie, and while it's a fine example of what's possible on a tablet, it's not quite an iPad—not yet at any rate. The large and tappable real estate means you can't use it in portrait mode, and with the flat design, there's no physical shutter button or current display mode (Cinema, for example). The stab at iPad app integration is Preference keys next to the Home and volume buttons to change movie levels and music playback, just like in iTunes. It does have a Live Closed Caption feature, but currently only for American TV broadcasts and not captioned by actors. Magnified views of transitions can be zoomed in individually, which is finally a nice touch for isolating things instead of just seeing a largish thumbnail. *PCMag* was (still is) tittering about the possibility of recording the vocals from a karaoke performance, but it hasn't happened yet. We're still waiting for iMovie 10's 4K feature. In the same vein as iMovie, Photodex created a sub-brand, CineForm, in 1999. PixPords and KeviImage, now two of several CineForm sub-brands, compete for the same market: getting the best color information from video shot with camcorders and DSLRs (among other things). CineForm's CaptureOne, reviewed in 2004, is still considered the gold standard in video capture and editing. Its palette-like interface and color controls mean you have ultimate control over the color of every frame you import or output. Plus, it's very efficient and nice for experienced users; it's not completely customizable, but you can easily get to your niche. CineForm is also head and shoulders above the competition in its output, while the former Bowie Digital Group CineForm business now sells its own product called AVCHD, which is about the only thing you can use when your camcorder or DSLR is an Apple product.

What It Does: There are several features within the Selections tool that enable you to make powerful selections. One of the most useful and most powerful tools is the Magic Wand tool. It allows you to select an area of the image which comprises a single, contiguous color. The Magic Wand works by setting a threshold on either the Hue or Saturation slider, which determines which colors of the image will be selected. Use the tool to preselect areas of the image that are accurately represented by the selected color palette. **What It Does:** Use the Eraser tool and the Crop tool to generate a new image version from an original image. As this image is being created, you can return to the original file, make any necessary small edits, and select another version from the Timeline to preview its progress. The Photoshop Keyboard shortcuts are the fastest way to get around in your images. Omeprise this when you are first learning. You can change most of the shortcuts on the keyboard by opening the "Preferences" window and clicking on "Keyboard." You can even assign shortcuts to perform actions like "CTRL+CLICK" for "Color Picker" or "CTRL +ALT+Z" for "Undo" if you find that you're holding down the keys at all times. One shortcut to practice is to "CTRL+Z" to "undo." This one is important to get master as you'll find yourself using it in every Adobe application on a fairly regular basis. Once you have your design project organized into layers, decide which layer you would like to work on first. The background layer is the one that's always visible. You can move, cut or do any number of other actions to a background layer. Any changes you make to a background layer automatically reflect in all other layers. Let's say you want to change the font color. Instead of opening each layer and changing the color individually, you simply open the layer you want to edit and then change the color. If you make changes to the background layer, they will be reflected in all layers. e3d0a04c9c
